

## Why Are Frogs Disappearing

### UV Radiation

- Lower hatching success
- Radiation can damage their DNA

### Pollution

- Frogs breath and drink through their skin so polluted swaps and water can harm them

### Loss of Habitat

- Draining wetlands
- Cutting down trees
- Building roads between ponds
- Industries
- Building on fields
- Farming
- Chemicals

### Climate Change

- Result of increasing greenhouse gases
- Different rainfall patterns and temperatures could reduce frog reproduction
