

## Attraction

*Dedicated to the “chemical” relationships in Ms. Pall’s class: ;)*

Chemistry.  
A world full of structures and bonds,  
Where attractions prevail, and relationships erupt  
So difficult to deny.

They feel the pull, those electrons do,  
Cuz of that proton’s deadly seduction,  
So attractive and secure.

And so they come.  
Closer n’ Closer.  
And the attraction, you ask?  
It increases as they come.

Cuz you see this level of attraction,  
Will determine their type of bond,  
Whether it be intimate or horrific.  
It’s all about to come.

They may be ionic, now don’t you see?  
But I do so hope its not.  
Ionic bonds are deadly.  
Possessive like a beast.

Electronegativity—one big one small,  
Will yield this fatal bond.

So you better hope, your difference is small,  
To get a covalent bond.
